

Execute JS

Last Updated Saturday, 24 October 2009

Execute JS is Firefox/Thunderbird-Extension which provides an enhanced JavaScript-Console, where you can comfortably enter and execute arbitrary JavaScript-Code and modify functions.

These are the features of Execute JS:

- Execute arbitrary (multiline) JavaScript Code in every open window
- Evaluating the properties of an object
- Modifying functions on the fly i.e. you can search for functions, load and edit them and eventually save the modified function.
- Execute JS provides a persistent history of the executed code snippets as well as a basic code completion functionality
- Shortcut notations for frequent used expressions can be configured. [Read more..](#)
