

## Highlight Focus

Last Updated Thursday, 27 November 2008

Highlight Focus is a Firefox-Extension which highlights textfields, selectboxes and textareas when getting focus with an configurable background and/or border color.

In addition it's configurable to vanish the highlighting on the first key press in the field.

Due to the fact that FF sometimes need a little bit time to start blinking the cursor this extension supports to keep track the input focus when moving the focus by keyboard.
